

BBC News Channel 'Viral: The 5G Conspiracy Theory' July 4-7 2020

Complaint:

It is sad to see the BBC again promoting unscientific theories about 5G and electromagnetic fields.

The programme should have stated clearly the following three facts.

1. Electromagnetic fields can affect and weaken the immune system. This has been known since 1960 and has been confirmed by many studies since then.
2. Epidemics and pandemics can be related to atmospheric electromagnetic fields. This has been known since 1799 and has been confirmed by many studies since then. Epidemics are, of course, also related to virions, the particles associated with viruses.
3. Sunlight is mainly non-ionising radiation but it can cause cancer. Non-ionising radiation such as extremely low frequency fields, which have much less energy than sunlight, can also cause cancer. This has been known since 1979 and has been confirmed by many studies since then.

The BBC should stop propagating its 5G 'conspiracy' theories and instead follow the mainstream scientific evidence on the established harm from radio frequency radiation.
